

ABSTRACT

The addition of silicone rubber fine particles to a  
5 composition comprising an organopolysiloxane having at least  
two alkenyl groups, an organohydrogenpolysiloxane having at  
least three SiH groups and a catalyst yields a composition  
which when coated onto any substrate, forms a coating whose  
surface is extremely reduced in gloss and highly uniform.  
10 Using the coating of the composition as a release sheet,  
synthetic resin sheets having matte surfaces can be readily  
manufactured.
